Abstract

In India, HIV and consequent AIDS is becoming serious health problem. It is not only common in males but also in females and among females, commercial sex workers facing the burnt. Hence in the present study impact of targeted intervention on HIV in female sex worker is assessed. A total of 3425 commercial sex workers were screened for HIV. Overall prevalence of HIV in commercial sex workers was found to be 0.44%. It is concluded that prevalence is declining among commercial sex workers due to targeted intervention program in India.
